

TOP LOAD COFFEEMAKER WITH  
FRONT ACCESS WATER RESERVOIR

ABSTRACT OF THE DISCLOSURE

A top-loading coffeemaker comprises a housing having an open top and two covers pivotable between opened and closed positions. A filter basket can be inserted through a front portion of the open top to be supported above a carafe. A reservoir is located in a rear portion of the top-loading coffeemaker. A conduit extends from an inlet at the front portion of the top-loading coffeemaker to the reservoir. Water poured into the inlet flows through the conduit to the reservoir. A linkage connecting the two covers causes the rear cover to be opened when the front cover is opened, and enables the rear cover to be opened alone.
